Course Description

This course introduces students to modern causal inference methods for analyzing data in economics and other social sciences. The goal is to help student develop a solid theoretical background in introductory level econometrics, the ability to implement modern techniques and to critique empirical studies in economics and other social sciences. Specifically, we will learn **six** modern econometric research design techniques that aim to credibly estimate causal effects:

- Randomized Trials
- Regression
- Decomposition
- Instrumental Variables
- Regression Discontinuity Designs
- Differences-in-Differences

At the end, students mastering tools will use at least one of them to finish an empirical research project.
